

NEWDEAL NAAF® Application Guide

WHEN TO USE—

- √ Best used on packed snow or ice. Also works well as a pre-treatment during freezing rain and sleet.
- √ Remove as much loose snow as possible from surface before applying deicer.
- √ Apply NewDeal NAAF. Give deicer time to work down to pavement surface before re-plowing. Pre-wetting with potassium acetate liquid is optional, but not necessary due to irregular shape of the deicer pellets.
- √ After plowing deiced surface, be prepared to reapply additional deicer as needed to prevent remaining slush/water from re-freezing (if air temp is below freezing).
- √ During an interruption in snow removal operations, NewDeal NAAF should be applied to prevent surface bonding of snow and ice. Doing so allows for easy removal of snow when snow removal operations resume.
- √ Application rates range from 3-14 lbs per thousand square feet.
- √ Application of deicer is not recommended on dry pavement surfaces covered with loose snow.
